**(54) METHOD FOR MAINTAINING DISCONTINUOUS TRANSMISSION AT BASE STATION OF MOBILE COMMUNICATION SYSTEM**

(57) Abstract:

FIELD: communications engineering; code-division multiple access systems. SUBSTANCE: in detecting discontinuous transmission mode type of last frame transmitted from mobile station is determined and current power control information is set according to type of frame. If frame is blank, transceiving system of base station sets current power control information for base station controller equal to preceding information used earlier for detecting discontinuous transmission mode. EFFECT: specific channel drop provision for data transmission periods only. 13 cl, 17 dwg, 17 tbl
